evaluateEmergencyCoolingTrigger(SensorReading reading)

AutomationRule.evaluateEmergencyCoolingTrigger

14 numbered nodes + Start, End and Exception exit · 22 edges
Cyclomatic complexity = 7 decisions (1, 2, 4, 5, 9, 11, 12) + 1 = **8**
(Same with the two exits counted as one: E − N + 2 = 22 − 16 + 2 = 8)

Paths
1→3 · 1→2→3 · 1→2→4→6 · 1→2→4→5→6 (to Exception exit)
…→9→10 · …→9→11→12→13 · …→9→11→12→14 · …→9→11→14 (to End)

Compound conditions (||, &&) are split into one decision per atomic condition, because Java short-circuits them.
